                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      N_Geneseq_032802:*

                        This is full-length CRI protein, and shortened forms are new, lacking the transmembrane region. The proteins and fragments bind C3b and/or C4b, have cofactor activity and inhibit C3 and C5 convertase activity They are useful in diagnosing and treating immune disorders, and prevented the convertase activity.
                                                                                    New nucleic acid sequences encoding new CR1 protein - and its for diagnosis and control of complement-related immune defects, inflammation, myocardial infarct, etc

The clones were present in the specifically primed lambda gtl1 CDNA library (Lambda HH) which was prepared with cDNA synthesised from poly(A) + RNA from DMSO induced HL-60 cells. The library was screened using probes CR1-1, CR-2 and CR1-4 (see Wong, WW et al.,1985, Proc. Nat. Acad. Sci. USA. 82:7711) and probe CR1-18 (corresponding to nucleotides 101-352 of this sequence). There are four direct, long homologous repeats of 450bp, each comprising 7 short consensus repeats. Nucleotides 28-1533 are also claimed separately.
                                                                               AAZ38150 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 1; Fig 1; 234pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a human C3B/C4B receptor (CR1) protein. The CR1 protein or fragment is expressed as a cell-surface protein on the surface of a non-human cell and exhibits a complement regulatory activity of full length human CR1 as expressed on erythrocytes. The CR1 function in vivo may be mediated through the inhibition of complement pathway enzymes. The soluble CR1 protein exhibits a complement regulatory activity, and this may be used to prevent reperfusion injury, inhibit Arthus reaction, and neutrophil mediated tissue damage, and reduce myocardial infarct size, and inflammation. The CR1 protein and its fragments can also be used in the treatment of conditions which involve unwanted complement activity, e.g. shock lung, tissue damage due to burn, or ischemic heart conditions, and autoimmune disorders. CR1 proteins, analogues, derivatives, and anti-CR1 antibodies are used in assays, and diagnostics. The present sequence represents a DNA encoding the human CR1 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     WPI; 1999-633357/54.

Wang
The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide
                                                                                                                                                                                                                                                                                                     Zhao

```
CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polypurase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC polypucleotides are also used in diagnostics as expressed sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC (III). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as considered in the same of the suseful for treating CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC diagnostics, forensics, gene mapping, identification of mutations in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC and to produce other types of data and products dependent on DNA and CC diagnostic coding sequences of this pattent did not appear in the printed consectification, but was obtained in electronic format directly from WIPO CC at ftp.wipo.int/pub/published_pct_sequences.

                                         CC molecular weight as membrane-associated CR1. CR1 binds C3b and C4b C2 that have covalently attached to immune complexes and other complement CC activators. The consequences of these interactions depends on the CT type of bearing the receptor. Erythrocyte CR1 binds immune complexes (CC type of bearing the receptor. Erythrocyte CR1 binds immune complexes (CC internalises bound complexes, either by adsorptive endocytosis is less (CC or by phagocytotsis. The function of CR1 on B lymphocytes is less (CC well defined. CR1 can inhibit the classical and alternative pathway (CC 3/C5 convertases and act as a cofactor for the cleavage of C3b and (CC 4b by factor I, therefore CR1 has a complement regulatory function (CC as well as acting as a receptor. CR1 is a glycoprotein composed of (CC as well as acting as a receptor. CR1 is a glycoprotein composed of (CC as ingle polypeptide chain. Four allotypic forms of CR1 have been (CC common forms, the F and S allotypes, also termed A and B allotypes, have molecular weights of 250 and 290 kD respectively. The two most (CC common forms, the F and S allotypes, also termed A and B allotypes, composed of common forms, the properties of approx. 40-50 kD. The two rarer (CC common forms, the F and S allotypes, also termed A and B allotypes, also termed A and B allotypes, (CC common forms, the F and S allotypes, also termed A and B allotypes, (CC common forms, the properties of 250 and 290 kD. These differences (CC common forms, the properties with endoglycosidase F. The CR1 gene has completed by treatment of the purified receptor portein with endoglycosidase F. The CR1 gene has completed by treatment of the deep subject the subject of the larger allotypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents the entire coding region for the C3b/C4b receptor (CR1). CR1 is present on erythrocytes, monocytes/macro-phages, granulocytes, B cells, some T cells, splenic follicular dendritic cells and glomerular podocytes. CR1 specifically binds C3b, C4b and inactivated C3b (iC3b). A soluble form of the receptor is found in plasma which has ligand binding activity and the same molecular weight as membrane-associated CR1. CR1 binds C3b and C4b

sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The CC invention also relates to vectors and recombinant host cells comprising a cc nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which cc bind to polypeptides of the invention Although novel, many of the cc polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities; and hence cc potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; cativin- or inhibin-related activities; chemotactic or chemokinetic activities; haemostatic, thrombotic or thrombotytic activities; activin- or inhibin-related activities; or may be call proliferation or metastasis.

CC Depending on their biological activities, polypeptides and nucleotides of the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoietic disorders (e.g., myeloid or lymphoid cell disorders), chronic inflammatory conditions (e.g., asthma or arthritis), atherometal activities (e.g., asthma or arthritis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     inhibin; chemotaxis; chemokinesis; thrombolysis; oncogenesis; proliferation; metastasis; cancer; tumour; haematopoletic disorder; myeloid cell disorder; lymphoid cell disorder; asthma; arthritis; chronic inflammatory condition; proliferative retinopathy; atherosclerosis; coronary heart disease; arterial ischaemia; bone disorder; osteoporosis; vascular growth disorder; tissue regeneration; wound healing; infection; immune disorder; tissue regeneration; wound healing; infection; antiinflammatory; antiasthmatic; antiarthritic; haemostatic; antiarteriosclerotic; cytostatic; osteopathic; vasotropic; cardiant; virucide; antibacterial; antifungal; vulnerary; antiulcer; ss.

CC vascular growth. Polypeptides involved with tissue regeneration and cC repair (or nucleic acids encoding them) may be used to promote wound CC healing (e.g., of burns, incisions and ulcers), while those with CC immunomodulatory activities may be used in the treatment of viral, CC bacterial and fungal infections in addition to immune disorders. CC Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to CC manipulate stem cells in culture to give rise to neuroepithelial cells CC that can be used to augment or replace cells damaged by illness, CC autoimmune disease or accidental damage. The polypeptides and nucleotides corrections techniques. The present sequence represents a cDNA encoding a CC novel human polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               γQ

The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as a localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, such as alzheimer's, parkinson's disease, Huntington's disease, such as Alzheimer's, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          21-JAN-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ş
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
                                                                                                                                                                                                                                                          New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutatio responsible for genetic disorders or other traits and to assess biodiversity

                                                                                                                                                                                                                                                                                                                                                           В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to isolated polynucleotide (I) and CC polypeptide (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC constant protection of (II) is sequence tags CC for identifying expressed genes. (I) is useful in gene therapy techniques CC (II). (II) is useful for generating antibodies against it, detecting or CC (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polypeptide in tissue, as molecular weight markers and as CC and supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. CC The polypeptide and polypucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC amino acid sequences. AAS64197-AB594564 represent novel human CC amino acid sequences of that and products dependent on DNA and CC amino acid sequences of the invention.

CC of the polypeptide and products dependent on DNA and CC appecification, but was obtained in electronic format directly from WIPO as the polypeptide and products of the printed of the polypeptide and products of the printed of the polypeptide and products of the polypeptide and products of the printed of the polypeptide and products of the polypeptide an

      control of the complement of the SCR3 of CR1-like pseudogene (see AAW79247). CM7 DNA was constructed using plasmid pDB1013-5, which codes for SCR1-3 of CR1, by site-directed mutagenesis using 3 pairs of oligonuclectides (see AAV53263-65) that introduced 10 amino acid changes to the native SCR3 sequence corresponding to changes conserved in the CR1-like pseudogene (Cr1pse). PBRTOCSCR1-3CM7 Carrying the CM7 DNA construct was used to transform Escherichia coli BL21(DE3), and CM7 was purified from solubilised inclusion beddies. The invention provides DNA sequences (see AAV53262 and CMAV53269-79) encoding novel soluble engineered CR1 polypeptides (see CC AAV53269-79) encoding novel soluble engineered CR1 polypeptides (see CC AAW53264-7) such as CM7 that act as complement inhibitors with CC activity. These can be used to treat a disease or disorder associated with inflammation or inappropriate complement activation, cs. such as neurological disorders (e.g. multiple sclerosis and Parkinson's disease), disorders of inappropriate or undesirable complement activation (e.g. xenograft rejection), inflammatory CC disorders (e.g. Crohn's disease, asthma, and acute pancreatitis), CC immune complex disorders and mount of sepsis, including and mount of sepsis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Soluble polypeptide comprising short used to treat disorders and diseases inappropriate complement activation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cox VF,

This DNA sequence encodes CM1 (see AAW79237), a protein that consists of the short consensus repeats (SCR) 1 and 2 from complement receptor type 1 (CR1) fused to an SCR3 (see AAW79242) in which 5 amino acids were altered to those found in the SCR3 of the CR1-like

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             inhibitors with functional complement inhibitory, including anti-haemolytic, activity. These can be used to treat a disease or disorder associated with inflammation or inappropriate complement activation, such as neurological disorders (e.g. multiple sclerosis and Parkinson's disease), disorders of inappropriate or undesirable complement activation (e.g. xenograft rejection), inflammatory disorders (e.g. Crohn's disease, asthma, and acute pancreatitis), post-isohaemic reperfusion conditions, infection or sepsis, arthritis, proliferative nephritis and myasthenia gravis), and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           pseudogene (Cripse) putative product. CMI DNA was constructed by site-directed mutagenesis (see AAV53263) of plasmid pDB1013-5, which codes for SCR1-3 of CR1. pBrocSSCR1-3CM1 carrying CM1 DNA was used to transform Escherichia coli BL21(DB3), and CM1 was purified from solubilised inclusion bodies. The invention provides DNA sequences (see AAV53262 and AAV53269-79) encoding novel soluble engineered CR1 polypeptides (see AAV53236-47) such as CM1 that act as complement
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 591 BP; 127 A; 159

                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC of the short consensus repeats (SCR) 1 and 2 from complement within the SCR3 of the CRI-11ke pseudogene (Cripse) putative product. CM2 DNA was constructed by CC site-directed mutagenesis (see AAV53264) of plasmid pDB1013-5, which codes for SCR1-3 of CRI. pBrocSCR1-30M2 carrying CM2 DNA was used to transform Escherichia coll BL21(DE3), and CM2 was purified from CC solubilised inclusion bodies. The invention provides DNA sequences (see AAV53262 and AAV53269-79) encoding novel soluble engineered CR1 polypeptides (see AAW53364-47) such as CM2 that act as complement inhibitors with functional complement inhibitory, including anti-haemolytic, activity. These can be used to treat a disease or CC disorder associated with inflammation or inappropriate complement activation, such as neurological disorders (e.g. multiple sclerosis and Parkinson's disease), disorders of inappropriate or undesirable complement activation (e.g. xenograft rejection), inflammatory CC disorders (e.g. Crohn's disease, asthma, and acute pencreatitis), CC post-ischaemic reperfusion conditions, infection or sepsis, cCC immune complex disorders and autoimmune diseases (e.g. rheumatoid CC archivetive disorders and autoimmune diseases (e.g. rheumatoid CC reproductive disorders.
                                                                                                                                                                                                                                                                                                                                            Matches
                                                                                                                                                                                                                                                                                                                                                                               Query Match

CC This DNA sequence encodes CM2 (see AAW79239), a protein that consists CC of the short consensus repeats (SCR) 1 and 2 from complement CC receptor type 1 (CRI) fused to an SCR3 (see AAW79244) in which 1 amino CC acid was altered to that found in the SCR3 of the CRI-like CRI pseudogene (Crlpse) putative product. CM3 DNA was constructed by CC site-directed mutagenesis (see AAV53265) of plasmid pDB1013-5, which Cc codes for SCR1-3 of CRI pBrocSCR1-3CM3 carrying CM3 DNA was used CC to transform Escherichia coll BL21(DE3), and CM3 was purified from CC solubilised inclusion bodies. The invention provides DNA sequences (see AAV53262 and AAV53269-79) encoding novel soluble engineered CRI CC inhibitors with functional complement inhibitory, including anti-haemolytic, activity. These can be used to treat a disease or CC disorder associated with inflammation or inappropriate complement CC anti-haemolytic, activity. These can be used to treat a disease or CC disorder associated with inflammation or inappropriate complement CC complement activation (e.g. xenograft rejection), inflammatory CC disorders (e.g. Crohn's disease, disorders of inappropriate or undesirable CC complement activation (e.g. xenograft rejection) inflammatory CC complement disorders (e.g. crohn's disease, asthma, and acute pancreatitis), CC post-ischaemic reperfusion conditions, infection or sepsis, rheumatoid CC architits, proliferative nephritis and myasthenia gravis), and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Complement receptor type-1; CR1; CM3; complement; inhibitor; anti-haemolytic; multiple sclerosis; Parkinson's disease; xenograft rejection; inflammation; Crohn's disease; asthma; pancreatitis; post-ischaemic reperfusion; infection; sepsis; autoimmune disease; rheumatoid arthritis; proliferative neph

Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1322376-132391, 1456007-1456775, and 1500552-1502855). Subtraction by Bento Soares and M. Fatima Bonaldo. "

Double-stranded cDNA was prepared from cell line RNA.
5' and 3' adaptors were used in cloning as follows: 5'
adaptor sequence: 5'-CACGGCCARTATGGCC-3' and 3' adaptor
sequence: 5'-ATTCTAGAGGCCGAGGTGGCCCAATG-dT(30)BN-3'
(Where B = A, C, or G and N = A, C, G, or T). Average
insert size 1.75 kb (range 0.9-4.0 kb). 15/15 colonies
contained inserts by PCR. This library was enriched for
full-length clones and was constructed by Clontech
Laboratories (Palo Alto, CA)."
